

Canonical

Plugin for Joomla! 3, 4 & 5

This manual documents **version 30.x** of the Joomla! extension.

<https://www.aimy-extensions.com/joomla/canonical.html>

1 Introduction

The Joomla! plugin **Aimy Canonical** allows you to set a *unique domain name* and *protocol* that is used to create a *canonical link tag* for all of your website's pages. **Aimy Canonical PRO** provides a couple of ways to handle a canonical link's *path* as well.

Using a canonical link tag helps to optimize your website for search engines, as it allows you to set a preferred domain and protocol used for all of your URLs. This way, the common *duplicate content* problem, which arises from multiple URLs having the same content, can be prevented.

Therefore, **Aimy Canonical** enriches your website's HTML code with a canonical link tag, which looks like this:

```
<link rel="canonical" href="https://my-domain.com/content.html" />
```

A typical canonical URL provides *protocol*, *domain* and *path* information – and maybe an appended *query string*:

This manual guides you through all steps necessary to install and use the plugin.

2 Supported Joomla! Versions

Aimy Canonical supports Joomla!...

- 3.9 and up,
- 4.0 and up,
- 5.0 and up.

3 Installation

The installation of the extension follows the common Joomla! procedures.

In case you are not familiar with these procedures, proceed as follows:

1. Download the extension's ZIP archive
2. Log into your Joomla! backend as "Super User"
3. From the menu, choose "*Extensions*" → "*Manage*" → "*Install*"
4. Click on the "*Or browse for file*" button and select the ZIP archive

The extension's archive will be uploaded and installed afterwards.

For further information, please have a look at the Joomla! documentation [Installing an Extension](#).

NOTE: All plugins are disabled by Joomla! when installed for the first time. To enable [Aimy Canonical](#), proceed and configure the plugin.

4 Configuration

After a fresh installation, click on the "*Configure plugin now*" button on the installation report page.

At any time, you can configure the **Aimy Canonical** plugin using Joomla!'s Plugin Manager by choosing "*Extensions*" → "*Plugin Manager*" from the menu. Locate the plugin and click on its name in the "*Plugin Name*" column of the plugin listing.

In order to use the plugin's functionality, you have to **enable it first**.

To do so, change the plugin's status from "*Disabled*" to "*Enabled*" and apply your changes by clicking on either the "*Save*" or "*Save & Close*" button in the toolbar.

Domain

Enter your website's preferred domain name.

The plugin will change the **main domain name** and is therefore valid on all pages of your website.

Enter your plain domain name (i.e. `my-domain.com`) **without** any protocol specification or path information.

Subdomains (i.e. `sub.my-domain.com`) may be set as a canonical link as well.

Protocol

You can select your preferred protocol used in your canonical URL. By changing the default of "`http`" to "`https`", so you can define your SSL-secured website as the canonical URL.

Remove Query String

Some Joomla! extensions append their required parameters as a query string to the pages of your website they are used on – even if SEF is enabled in Joomla!'s global configuration. In some cases this query string is then appended to your canonical URL as well.

If enabled, this option removes the query string from your canonical URL.

NOTE: The query string is only removed if SEF is enabled.

Cleanup Query String (PRO Feature)

If enabled, parameters of the query string of a canonical URL are sorted and the "=" character is removed in front of empty values.

Example: "`x=ab&ab=x&z=&q=`" is transformed to "`ab=x&q&x=ab&z`".

NOTE: This option is only available if the *Remove Query String* option is disabled.

Add Pagination Parameters (PRO Feature)

Adds pagination parameters to the canonical URL as a query string (i.e. "`start=5`") if required on that page **and** the *Remove Query String* option is enabled.

Add Search Parameters (PRO Feature)

Add search parameters to the canonical URL as a query string (i.e. "`q=term`") if required on that page **and** the *Remove Query String* option is enabled.

Trailing Slashes (PRO Feature)

To prevent duplicate content issues and to keep your website's canonical link paths consistent with the way links are placed on your website, **Aimy Canonical PRO** allows you to customize trailing slash handling.

Keep As-Is

Trailing slashes will be kept as-is.

Remove

Trailing slashes are removed from a page's canonical link path.

Examples:

- `"/index.php/about-us/"` → `"/index.php/about-us"` (Plain SEF)
- `"/about-us/"` → `"/about-us"` (SEF & URL Rewriting enabled)
- `"/about-us.html/"` → `"/about-us.html"` (SEF & URL Rewriting & Suffix enabled)

Add

A single slash is added at the end of a page's canonical link path if necessary.

NOTE: If "Add Suffix to URL" is enabled in the "SEO Settings" of Joomla!'s Global Configuration, this option is not evaluated.

Examples:

- `"/index.php/about-us"` → `"/index.php/about-us/"` (Plain SEF)
- `"/about-us"` → `"/about-us/"` (SEF & URL Rewriting enabled)

NOTE: If SEF is disabled, this option is not evaluated.

Remove even on Homepage? (PRO Feature)

If enabled, trailing slashes will be removed on the homepage as well. This may result in an empty path in the canonical link (i.e. `https://example.com`). This option is only available if *Trailing Slashes* is set to *Remove*.

Remove /index.php? (PRO Feature)

If enabled, `"/index.php"` will be automatically removed from a canonical URL's path.

NOTE: This feature requires both "Search Engine Friendly URLs" and "Use URL Rewriting" to be enabled in Joomla!'s "Global Configuration".

Cleanup <head> (PRO Feature)

Under some conditions, **multiple canonical link tags** may be inserted into your pages' <head>. For example, the designer of your Joomla! template may insert one as well as a SEO extension you have installed on your website, without using Joomla!'s mechanism for handling links in a page's <head>.

If this is the case, just enable this option and **Aimy Canonical PRO** will clean up any canonical link tag from your head automatically and insert a single one at the end of the page's <head> afterwards.

Use <base> Path (PRO Feature)

Under some conditions, the path of the SEF-URL generated by the component which handles a page may not be accurate.

If this is the case, enable this option to use the path of the <base> element's `href` attribute instead.

NOTE: If SEF is disabled, this option is not evaluated.

Convert Case? (PRO Feature)

Should the case of the canonical link's *path* be automatically converted?

Keep As-Is

No conversion, the path is kept as-is.

Lowercase

All letters of the canonical link's path will be converted to lowercase.

Uppercase

All letters of the canonical link's path will be converted to uppercase.

NOTE: If SEF is disabled, this option is not evaluated.

Enable Custom URL Support (PRO Feature)

If enabled, a custom URL may be set in a special "*Aimy Canonical*" tab for any content of a supported Joomla! component.

Have a look at the chapter "*Using Custom Canonical URLs*" for details.

NOTE: If SEF is disabled, this option is not evaluated.

Enable Redirects (PRO Feature)

If enabled, **Aimy Canonical PRO** will send a redirect if a mismatch between a page's URL ("address") and the chosen parts of its canonical URL occurs.

You can choose on which condition or conditions such a redirect should be used:

On Protocol Mismatch

If the protocols differ, i.e. "http" vs. "https".

On Domain Mismatch

If the domain name differs, i.e. "www.my-domain.com" vs. "my-domain.com".

On Path Mismatch

If the path differs, i.e. "/" vs. "/index.php".

NOTE: Path mismatches will be ignored for AMP pages.

On Query String Mismatch

If the query string differs, i.e. empty vs. "rCH=2".

After you enabled the plugin, **Aimy Canonical** will automatically generate and insert a unique canonical link tag to all pages of your website.

No further action required – unless you like to assign a custom URL to (some of) your website's pages!

5 Using Custom Canonical URLs (PRO Feature)

Aimy Canonical PRO allows to set a custom canonical URL to specific content which is used regardless of the URL that points the content. You may enter a custom path and can choose to override the default settings made in Aimy Canonical's configuration for the protocol and domain part of the URL.

A special new tab (labeled "*Aimy Canonical*") is placed right where you edit your content, so the path can be easily assigned and maintained. To get the tab, make sure the "*Enable Custom URL Support*" option is switched on.

The screenshot shows the Joomla! administrator interface for editing a menu item. The top navigation bar includes a search icon, a hamburger menu icon, and the text "Menus: Edit Item". On the right, it shows Joomla! version 5.2.0 and a "Joomla! Website" link. Below the navigation bar are buttons for "Save", "Save & Close", "Close", and "Help".

The main content area is divided into two columns: "Title *" and "Alias". The "Title *" field contains "Contact Form" and the "Alias" field contains "contact". A note below the "Alias" field states: "The Alias will be used as part of the URL."

Below these fields is a tabbed interface with the following tabs: "Details", "Contact Display Options", "Mail Options", "Link Type", "Page Display", "Metadata", and "Aimy Canonical". The "Aimy Canonical" tab is currently selected.

The "Aimy Canonical" tab contains the following content:

Aimy Canonical

If you set the canonical path for this item, keep in mind that...

- only the canonical path should be given, **not domain or protocol** (use the option Override Protocol/Domain in this case if necessary)
- the **complete path** must be given (i.e. `/blog/category/article.html`)
- **other path related plugin settings are ignored** (i.e. *Trailing Slashes*)

If you enter...

- an **absolute path** (that starts with a slash), the path will be kept as is
- a **relative path** (no leading slash), the path is prefixed with the website's base path as well as `index.php` if required by your website's Joomla! SEF configuration

Canonical Path:
Set the canonical path for this item.

Override Protocol/Domain?: No Yes
Do you want to override the default plugin settings of protocol and/or domain for this item?

5.1 Supported Components

This feature is currently supported for the following components:

Joomla! Articles (`com_content.article`)

Joomla! Category Descriptions (`com_content.category`)

Joomla! Tag Descriptions (`com_tags.tag`)

Joomla! Menu Items

Except for those of the "*System Links*" category: "Menu Heading", "Menu Item Alias", "Separator" & "URL".

5.2 Notes and Limitations

5.2.1 Custom Paths

All other **path related options** of **Aimy Canonical PRO** (i.e. "*Use <base> path*" or "*Trailing Slashes*") won't take effect for custom canonical paths. However, all other options are evaluated, that means protocol and domain are set according to your preferences, query strings are processed as configured and redirects will be send when enabled (and appropriate).

If a custom canonical URL has been assigned to both content and its menu item (that directly references it), the custom canonical URL assigned to the menu item is used instead of the one assigned to the content.

Aimy Canonical PRO does not check whether the entered path is actually handled by your website or correct – you need to take care of that yourself. That means, **Aimy Canonical PRO** inserts the custom path you entered, but does not route a request to that path on your website to the content.

Be sure to set the **complete path** (i.e `/blog/category/article.html`). If you enter an **absolute path** (that starts with a slash), the path will be kept as is. In case of a **relative path** (no leading slash), the path is prefixed with the website's base path as well as `index.php` if required by your website's Joomla! SEF configuration.

This feature requires SEF to be enabled.

5.2.2 Pages with noindex

If a page's meta robots information contains `noindex`, **Aimy Canonical** will not set the canonical link tag on that page.

5.2.3 Frontend Editing

If frontend editing is used, the canonical link tag will be omitted for the active user session. To inspect the canonical link tag in the HTML code of a page during frontend editing, either wait until you logged out, use an external tool or a second browser (instance).

6 Extension Specific Hints

Some extensions require extra logic in order to generate an appropriate canonical URL:

6.1 VirtueMart (PRO Feature)

Aimy Canonical PRO includes a workaround to enable **SEF canonical URLs** for VirtueMart. With the PRO version installed, no further action is required if you enabled SEF on your website.

6.2 Stock Joomla! Components (PRO Feature)

In some cases, the SEF URL's path generated by stock Joomla!'s components used in a page's canonical URL may not be correct.

For example, this is the case on article pages that are not directly referenced by a menu item and referenced using an URL that is misspelled but still resolvable by the component. As a result, the page is shown in the frontend, but the generated SEF URL's path is not correct and, if followed, results in a 404 error.

Besides that **arbitrary paths** may be used in a SEF URL that contains a leading numeric Id under certain conditions, i.e.:

```
https://my-domain.com/blog/2-article (the correct one)
```

```
https://my-domain.com/blog/2-this-should-not-work-but-it-does
```

Aimy Canonical PRO detects and fixes most of these issues automatically for the following Joomla! components & their views:

Joomla! Articles (`com_content.article`)

Joomla! Category Descriptions (`com_content.category`)

Joomla! Tag Descriptions (`com_tags.tag`)
