

## Geo Tax for J2Store

Plugin for Joomla! / J2Store

This manual documents **version 6.x** of the Joomla! / J2Store extension.

<https://www.aimy-extensions.com/joomla/geo-tax-for-j2store.html>

# 1 Introduction

Aimy Geo Tax for J2Store adds one useful feature to your shop: the detection of the **geographic region** each customer is coming from, based on his IP address.

This information is used to internally set the user's **country** (billing address) before a cart checkout. Besides that the **tax** and **tax rate** displayed by J2Store is customized to fit the user's location automatically and right away.

Aimy Geo Tax for J2Store comes with a set of 241 country flags and allows both **country flags** and **country names** to be shown next to the tax rate.

This manual guides you through all steps necessary to install and use the plugin.

## 2 Requirements

In order to use Aimy Geo Tax for J2Store, you have to meet the following technical requirements:

1. Joomla! (version 3.x or version 4.x (*recommended*)))
2. J2Store (version 3.1.7 or up or version 4.x (*recommended*)))
3. *one of the following:*
  - a) PHP MaxMind-DB extension (*1.11.0 or up recommended*) and either  
MaxMind's GeolP2 "Country" or GeoLite2 "Country" database  
or  
DB-IP's "IP to Country" or "IP to Country Lite" database in MMDB format
  - b) PHP GeolP extension (version 1.x.y, *1.1.y or up recommended*) and  
MaxMind's GeolP "Country" or "Country Lite" database (legacy format)

To find out whether your PHP setup already includes the PHP GeolP extension, log in to your Joomla! backend and click "System" → "System Information" → "PHP Information". Have a look for a "geoip" or "maxminddb" heading - if present, the PHP extension is already installed and ready for use.

**We recommend using the PHP MaxMind-DB extension.**

**NOTE:** The legacy *Akeeba GeolP Provider Plugin* (Joomla! system plugin) is still supported by Aimy Geo Tax for J2Store but its usage is not recommended as it is not maintained anymore.

### 3 Installation

The installation of the extension follows the common Joomla! procedures.

In case you are not familiar with these procedures, proceed as follows:

1. Download the extension's ZIP archive
2. Log into your Joomla! backend as "Super User"
3. From the menu, choose "*Extensions*" → "*Manage*" → "*Install*"
4. Click on the "*Or browse for file*" button and select the ZIP archive

The extension's archive will be uploaded and installed afterwards.

For further information, please have a look at the Joomla! documentation "*Installing an Extension*".

**NOTE:** All plugins are disabled by Joomla! when installed for the first time. To enable Aimy Geo Tax for J2Store, proceed and configure the plugin.

## 4 Configuration

After a fresh installation, click on the "*Configure plugin now*" button on the installation report page. At any time, you can configure the Aimy Geo Tax for J2Store plugin using J2Store's Applications Manager ("Apps" menu item). Click the "*Open*" button to load Aimy Geo Tax for J2Store's configuration dialog.

### 4.1 Enabling the Plugin

In order to use the plugin's functionality, you have to enable it first.

Go to J2Store's Applications Manager and click the "Enable" button in Geo Tax for J2Store's box.

### 4.2 Plugin Options

Aimy Geo Tax for J2Store's functionality can be suited to your needs using the following configuration options:

App - Aimy Geo Tax for J2Store

Cancel Save Save & Close Back to dashboard

Aimy Geo Tax for J2Store (PRO)

GeoIP Backend in use: MaxMind DB PHP extension

Show Country Flags? \*

Show Country Names? \*

Default Country \*

Custom GeoIP Path

Test IP

#### Show Country Flags

If enabled, a flag of the user's originating country will be shown near the tax information.

#### Show Country Names

If enabled, the name of the user's originating country will be shown near the tax information.

#### Default Country

If set to "*Shop's Country*" the country your shop is located in will be used as a fallback. This information is retrieved from the setting you did in J2Store's configuration.

To disable setting a fallback country, choose "*None*".

We recommend keeping the default setting as is, that is, using the shop's country as a fallback.

### Custom GeoIP Path

This option is only evaluated if the PHP GeoIP or PHP MaxMind-DB extension is used as a GeoIP provider.

If the **PHP GeoIP extension** is used as a GeoIP provider, the GeoIP database ("GeoIP.dat") is usually installed in a default directory and picked up from there by the libraries which use the database automatically.

If you did install your database into a custom directory and have the *geoip* PHP extension in a version *above or equal* to 1.1.0 installed, enter your custom path in the input field.

If you use a version *lower* than 1.1.0. edit your `php.ini` and set the configuration directive "geoip.custom\_directory" to point to your directory.

If the **PHP MaxMin-DB extension** is used as a GeoIP provider, entering the path of the directory that holds the MMDB databases is required. Aimy Geo Tax for J2Store will then try to locate the correct file automatically. However, you can enter the complete path of a MMDB file as well.

### Test IP

For testing purposes you can enter an arbitrary IP address that will be passed to the GeoIP provider instead of the real visitor's IP address.

Make sure to disable this option after testing and delete your frontend session cookie afterwards.

After setting up these options to suite your shop's and setup's needs, Aimy Geo Tax for J2Store is ready for use.

## 4.3 Shop Settings

Aimy Geo Tax uses the settings and data you configured in J2Store itself, for example: Countries, Geozones, Tax rates or Tax profiles.

You may use the plugin with net or gross prices.

## 5 GeoIP Provider

Aimy Geo Tax for J2Store automatically tries to determine which provider to use on your website. First, Aimy Geo Tax for J2Store looks for a usable installation of the PHP MaxMind-DB or GeolIP extensions. If both cannot be found on your webhost, a check for the Akeeba GeolIP provider plugin is done.

## 6 GeolP Database Information

### 6.1 PHP MaxMind-DB extension used

Aimy Geo Tax for J2Store can use MaxMind's or DB-IP's commercial or lite country database in version 2 ("MMDB") database format.

For more information, visit:

<https://www.maxmind.com/en/geoip2-country-database>

and/or

<https://db-ip.com/db/>

Linux users may install this database using their distribution's package manager as well. If in doubt, ask your webmaster or system administrator which way fits your setup best.

Keep in mind to update your copy of the GeolP2 country database regularly.

### 6.2 PHP GeolP extension used

Aimy Geo Tax for J2Store can use either MaxMind's commercial or lite country database in version 1 ("legacy") database format.

To get more information on the country lite database and download your copy, follow this link:

<https://dev.maxmind.com/geoip/legacy/geolite/>

Linux users may install this database using their distribution's package manager as well. If in doubt, ask your webmaster or system administrator which way fits your setup best.

Keep in mind to update your copy of the GeolP country database regularly.

### 6.3 Akeeba GeolP Provider Plugin used

The GeolP database bundled with the extension is used.

**NOTE:** The plugin is obsolete and not maintained anymore.

## 7 Country Selection Algorithm

Aimy Geo Tax for J2Store uses the following sequence of checks to set the internally used billing address' country to the one of the user visiting your website:

### User set his country already?

If the user is a recurring one and already set his country information before, this authoritative setting will still be present in the user's **session**. Aimy Geo Tax for J2Store will keep this information as is and just load the matching language name and flag if configured to.

### GeolP lookup?

*Otherwise:* If the user's IP address has a matching entry in the **GeolP** database, the country code is retrieved.

If you did enable the user's country in J2Store, the country information (name & flag) is loaded and the billing address' country is set to the retrieved one.

### Fall back to shop's country as a default?

*Otherwise:* If you did set "*Default Country*" to "*Shop's Country*" in Aimy Geo Tax for J2Store's settings, the shop's country will be used to set the billing address' country and country information will be loaded accordingly (name & flag) as a **fallback**.

The tax and tax rate are then calculated as appropriate by J2Store before being displayed to the user. The country's name and flag will be added if set in Aimy Geo Tax for J2Store's configuration.

**Note:** In any case, the setting of the user within the checkout process will finally decide on the calculation of the tax rate.

## 8 Styling Country Information Using CSS

The following code shows an example HTML snippet of a product's price information including tax rate and country information:

```
<div class="product-price-container-wrapper">
  <div class="product-price-container">
    <div class="sale-price">25.00€</div>
    <div class="tax-text">(Incl. 19% tax)</div>
  </div>
  <div class="tax-country tax-country-de">Germany</div>
</div>
```

25.00€  
(Incl. 19% tax)  
 Germany

The class "tax-country-XX" is used to add the country's flag to the `div` element (as a background image), XX denotes the two letter ISO 3166-1 country code, in this example "de" for Germany. Any code required to handle and place the flags is provided by Aimy Geo Tax for J2Store and loaded automatically if "*Show Country Flags*" is enabled.

You are free to apply styling as appropriate for your website by extending your template's CSS code.

The default style applied is as follows (excluding the `tax-country-XX` classes):

```
.tax-country
{
  display: inline;
  padding-left: 24px;
  background-color: transparent;
  background-repeat: no-repeat;
  background-position: center left;
}
```

## 9 Debugging

Aimy Geo Tax for J2Store does provide a debugging mode that is enabled by setting "*Debug System*" to "Yes" in Joomla!'s "*Global Configuration*" ("*System*" tab).

If enabled, a short notice will be shown about which country has been selected for a request and by which source it has been determined:

**Message**

Aimy Geo Tax for J2Store: Source: Session → Germany

**Message**

Aimy Geo Tax for J2Store: Source: GeolP → Germany

**Message**

Aimy Geo Tax for J2Store: Source: Fallback → Germany

We recommend using the debugging output for testing purposes on a staging system only.
